

ABSTRACT OF THE DISCLOSURE

In a first embodiment of the invention, when an Activate PDP Context Request message is forwarded to a Service GPRS Support Node (SGSN), the SGSN creates a Create PDP Context Request message and forwards it to a Gateway GPRS Support Node (GGSN). In response to the Create PDP Context Request forwarded by the SGSN, the GGSN creates a Create PDP Context Response message. When a PDP context is created by the GGSN, the GGSN associates a Charging Id parameter with the PDP context. Then, the Create PDP Context Response including the Charging Id parameter is forwarded to the SGSN. The Charging Id parameter is sent from the SGSN to the UE and from the UE to the CSCF. In a second embodiment of the invention, the Charging Id parameter is sent from the SGSN or the GGSN directly to the Call State Control Function (CSCF). Sending the Charging Id parameter can be performed either autonomously or based on a request from the CSCF.
